Troubleshooting connection problems within device range

## IoT device docs

## Introduction

This is the documentation landing page for a hypothetical IoT device. It demonstrates a user paced walkthrough of simple instructions with a placeholder narrator (Motion Storyline also allows you to replace audio with a recording of your voice from inside the application, or a professional voice-over if you upload one).

# Overview

Our specialized IoT device can be placed on our mounted pole to give it a high vantage point for video recording. Data is then offloaded by bringing the device down and ejecting the media device to transfer over files, or footage can be transferred over local intranet (see guide).

## Step one

Locate and remove panel cover to the cable interface dock, and plug in the micro USB cable.

## Step two

Connect USB cable to your phone or tablet, and go back into 'connection diagnostics settings' in our owner's app.

## Step three

Network settings should begin to sync automatically, and fix any detected issues. Any issues will display on the settings tab.
